

Electron-density contours

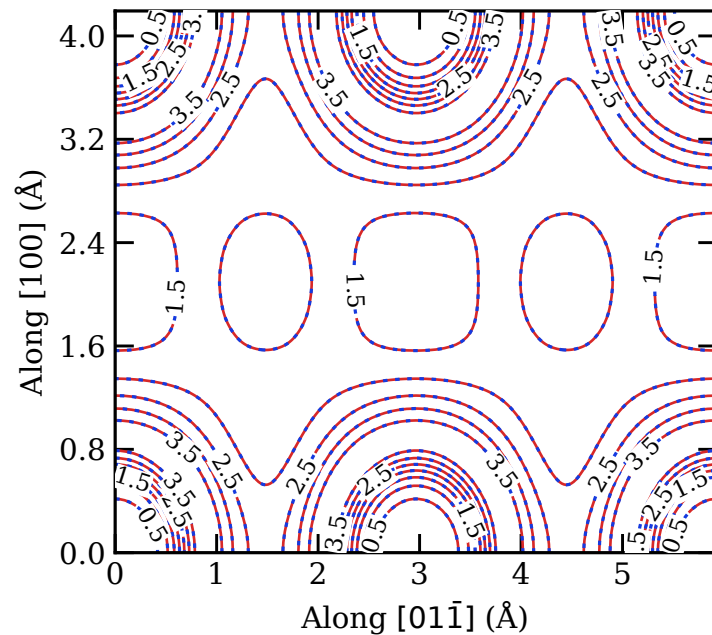

TF + λ vW, $\lambda = 1/5$ · OEPP · PZ-LDA

— GradSCF ···· DFTpy

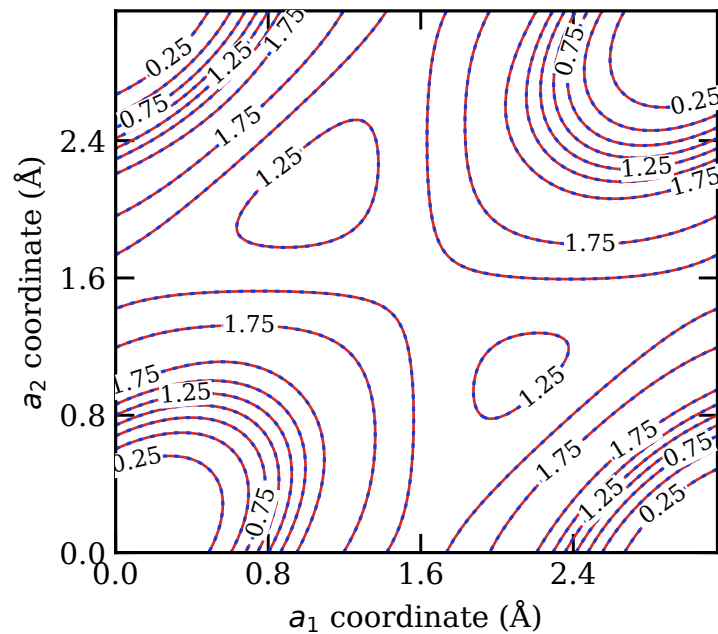

(a) Al (001)

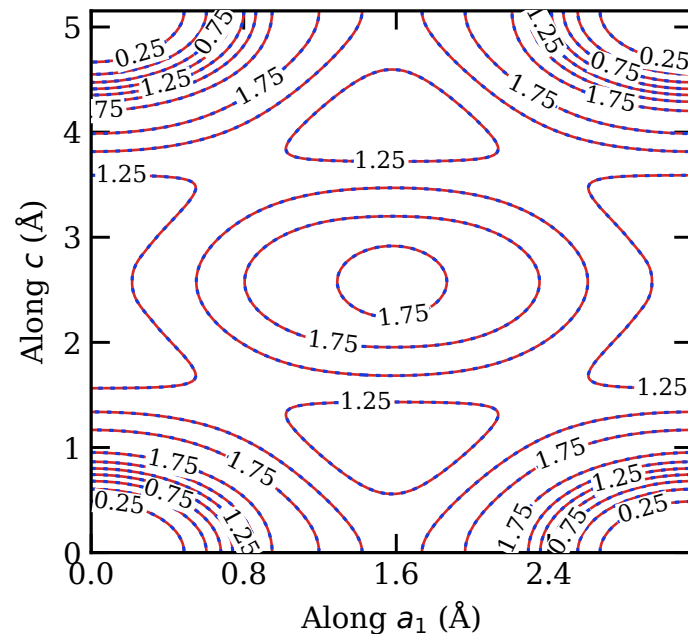

(b) Al (011)

(c) Mg (0001)

(d) Mg (011̄0)

Contour labels show $100n$, with n in electron/Bohr³; coordinates are in Å.
The same contour levels are used for both codes and both sections of each material.
Periodic Fourier interpolation adds sampling points without blurring the calculated density.

Panels have independent axis scales. Mg basal coordinates follow a_1, a_2 (120° apart); ideal c/a is assumed.
These are TF + λ vW results at the stated reference volumes, not the paper's WGC Table 1.
