

Density slices: GradSCF, DFTpy, and their difference

TF + $\frac{1}{9}vW$ · OEPP · PZ-LDA · target spacing 0.18 Å

Actual mesh values on the fractional $w=0$ plane, spanned by primitive a_1 and a_2 ; axes are fractional, not Cartesian.
Each row shares its absolute-density scale. Difference maps use a separate symmetric scale. Periodic endpoints are repeated; no smoothing.
